RECENT FINDINGS / PRODUCT DIRECTION

Glass Clock

What we have learned - and how it fits together

THE CENTRAL CONCLUSION

Build one clear product now. Keep the wider ecosystem as a separate, longer-term opportunity.

Glass Clock is the customer-facing clock experience. The Sandbox is the workshop. Plugins and agents are the machinery that helps us explore, improve and eventually scale what works.

How the pieces fit together

01 / GLASS CLOCK

The product people use. A dependable, customisable clock widget with a distinctive glass-led identity.

02 / GLASS SANDBOX

The private workshop. Pip, dashboard ideas, creative experiments and prototypes live here first.

03 / PLUGINS + AGENTS

The enabling system. Reusable tools and specialist workflows that help us research, build, test and market.

The findings that matter

AREA	FINDING	WHAT IT MEANS
V1 focus	The strongest product definition is a customisable glass clock widget that can be previewed at real Home Screen size.	Anything that does not improve the clock, customisation, readability or reliability waits. Do not turn V1 into a general dashboard or AI platform.
Visual identity	Glass should feel like a deliberate material, not an effect applied everywhere. Cohesion matters more than any single flourish.	Prioritise legibility, spacing, hierarchy, tactile interactions and restrained depth. Keep nostalgia subtle and make the identity original.
Plugin system	The Affinity discussion sharpened the bigger-picture idea: a strong core product could sit within a wider ecosystem of specialist capabilities.	Treat that as a long-term opportunity, not a V1 promise. Keep plugins modular and sandbox-first, with clear roles, handovers and approval. Proven experiments can become simple built-in features.
Design skills	The skills research points to reusable design judgement, component patterns, motion guidance and browser-based testing.	Use specialist workflows to improve consistency and QA. Treat social-media claims as leads to verify, not proof that every tool is needed.
Pip	Pip works best as an optional, lightweight character with local behaviour; the proposed Design Partner is a separate experiment.	Do not make the clock depend on AI, connectivity or a companion. Keep Pip quiet, dismissible and out of V1 unless testing shows clear value.
Marketing	The Instagram-agent example shows how post ideas, formats, timing and draft content can be organised as a repeatable workflow.	Market the finished experience, not the plugin machinery. Show real widget outcomes and customisation; use agents for planning and drafting, with human review before publishing.

IMPLICATIONS / NEXT MOVES

What this means in practice

Recommended next steps

01	**Protect the V1 boundary** Write down the launch promise and the definition of done. Park games, deeper AI, extra dashboards and ecosystem ideas unless they directly improve the core clock.
02	**Prove the build on the device** Use the Simulator for layout checks, but validate gestures, glass over real backdrops, saved settings, accessibility and smoothness on the actual iPad. Stability comes before adding more.
03	**Refine a small set of clock experiences** Develop a few genuinely useful and distinct presets. Check them at real widget sizes, in light and dark contexts, with contrast and reduced-motion needs in mind.
04	**Learn from real testers** Record what people customise, what they leave alone, what confuses them and what they return to. Use that evidence to simplify before expanding.
05	**Build marketing support separately** Create a lightweight internal workflow for post ideas, short demos, captions and a content calendar. Prioritise clear product demonstrations and keep final publishing under human control.
06	**Keep the bigger experiments alive - but contained** Continue exploring the plugin platform, Pip and cross-app ideas in the Sandbox. Promote only the parts that prove useful, affordable and reliable.

Direction vs. open questions

DIRECTION TO ACT ON	NOT YET PROVEN
Keep Glass Clock focused and reliable. Keep the Sandbox separate. Use cohesion and accessibility as quality checks. Keep Pip and AI optional. Prefer fair, useful extras over ads or pressure.	Demand for a wider plugin ecosystem. Whether Pip, games or extra tools improve retention. Which styles and controls users value most. The strongest audience segment and marketing channel. The right pricing or expansion model.

A simple filter for new ideas

01 Does it make the core clock experience better? **02 Can we test the benefit with real users or real-device evidence?**
03 Can it stay lightweight, optional and easy to remove?
